ABSTRACT OF THE DISCLOSURE

The present invention provides a process whereby fluorine atom-containing sulfonyl fluoride compound(s) useful as e.g. materials for ion-exchange membranes, can be produced efficiently and at low cost without structural limitations while solving the difficulties in production.

Namely, the present invention provides a process which comprises reacting $XSO_2R^A-E^1$ (1) with R^B-E^2 (2) to form $XSO_2R^A-E-R^B$ (3), then reacting (3) with fluorine in a 10 liquid phase to form $FSO_2R^{AF}-E^F-R^{BF}$ (4), and further, decomposing the compound to obtain FSO₂R^{AF}-E^{F1} (5), wherein RA is a bivalent organic group, E1 is a monovalent reactive group, RB is a monovalent organic group, E2 is a monovalent reactive group which is 15 reactive with E1, E is a bivalent connecting group formed by the reaction of E^1 with E^2 , R^{AF} is a bivalent organic group formed by the fluorination of RA, etc., RBF is the same group as R^B , etc., E^F is a bivalent connecting group formed by the fluorination of E, etc., E^{F1} is a 20 monovalent group formed by the decomposition of EF, and X is a halogen atom.
